

Kongu Day 5

① Hooks

- ↳ useState ✓
- ↳ useEffect
- ↳ useRef
- ↳ useContext
- ↳ useMemo

What is Hooks?

Hooks are nothing but a normal function

useState(0)

var [variable, function] = useState(0);

② useEffect()

It is a side effect that is gonna do nothing

↳ happened when your use state is updated.

Syntax:

useEffect(function, dependency)
useEffect(function, [text])
useEffect(function, [text])
↑

- ① It is a reaction of whatever action that you perform to a specific state.
- ② The reaction time of your use Effect is very fast which could not be noticed by human eye.
- ③ When to use dependency (state variable)

... Δ ... \rightarrow you can use axios

npm i axios

axios.
 .get
 .post
 .put
 .patch
 .delete

UseRef:

↳ Re-rendering ✓
↳ Mostly like a use state

useRef.

useEffect

Refered

var preload = useRef();

useState("")

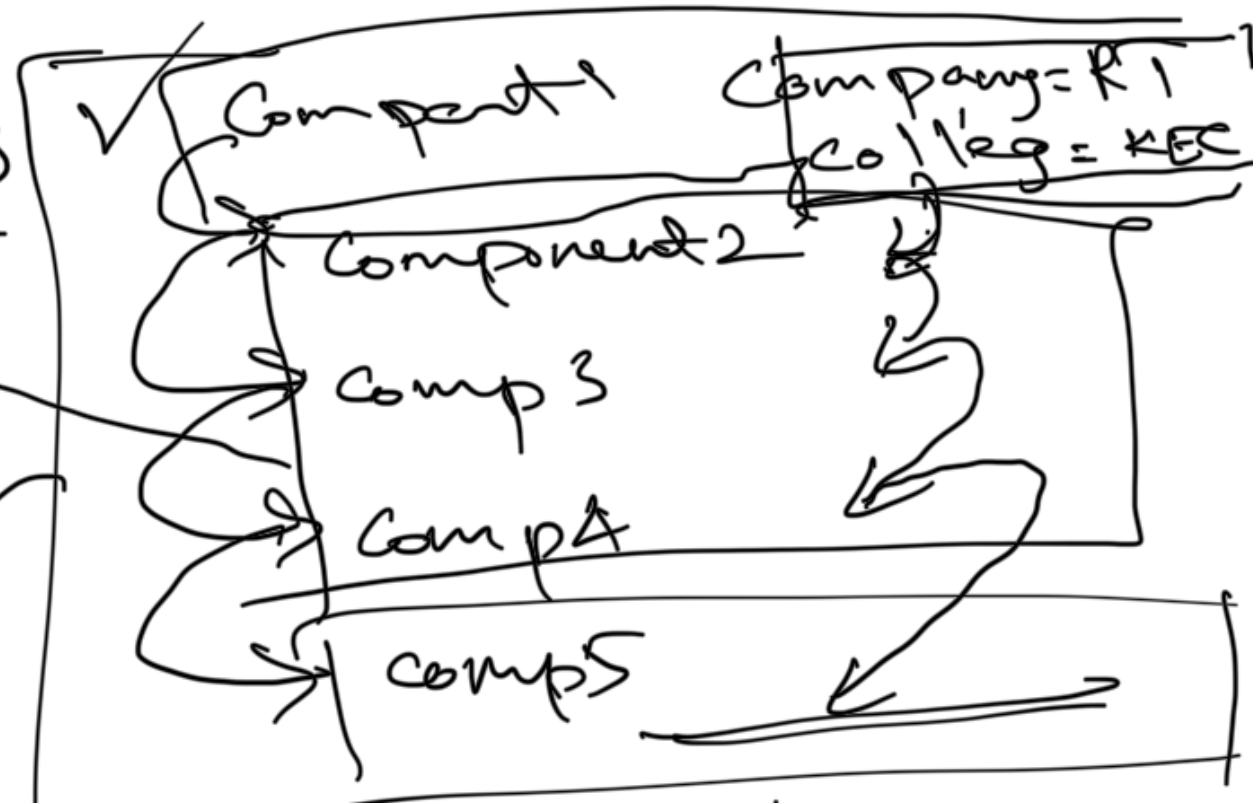

useEffect(() => {

return ()

Use Context => Global state / props management hook.

① const examResults = CreateContext

memory leak

use Memoization.

useMemo

> X drilling.

It will memorize a variable which can be changed during run time without any delay.

useMemo(c) ⇒ {3, [3]}

var doubleNumber = useMemo(c) ⇒ {3, [3]}.
